

# Blueprints (TBR)

Sites are created from blueprints which allow us to generate them with predefined contents and configurations. Moreover new blueprints can be created from a site, and they can also be exported and imported to the crafter studio blueprints directory found in the repository allowing the creation of more sites based on the new blueprint.

## Anatomy of a Blueprint

/company Home/cstudio/site- blueprints

From a blueprint we get:

- Site Configuration
- Content Types
- Site Content and Inheritance Permissions
- Repository Rules

## Creating, Importing and Exporting Blueprints

Creating, importing and exporting blueprints can be accomplished by using any of these methods:

- Export as ACP or ZIP (ACPs carry permissions and rules)
- Alfresco Explorer: Which is still the best Web UI for import and export from the repository.
- Shared Drive
- WebDAV
- FTP

To look into the details of creating, exporting, and importing blueprints follow this link: [Create a site Blueprint](#)
